YOUR HOME – YOUR REFLECTION

The goal of decorating your house is to create a cosy and welcoming environment. It's all about surrounding yourself with meaningful objects. And mixing components that appeal to your senses.

The floor is among these components that is most crucial. The entire decor is influenced by the way the floor feels and appears. It is for this reason that you should never undervalue the work of selecting the ideal floor for your needs and preferences. Since this is about your house, only the best ought to be enough.

GF Parquet offers an extensive selection of superior hardwood flooring. Hence, regardless of your preference, you should be able to choose a sturdy floor that will enhance your house for many years to come. We have the skills and understanding to realise your ideal home, if you have one.

cool, composed, and unflappable. Light flooring provides a calm and elegant background that is ideal for emphasising furniture and home accents. Additionally, they amplify natural light, giving a space more air and spaciousness.

3-LAYER ENGINEERED FLOORING

Top Layer -

Selection of White Oak, protected with multiple layers of lacquer or oil

Locking system

Quick and easy installation for floors that can be walked on immediately after installation. Suitable for heated floors

Middle Layer -

Pine/ Poplar or other Coniferous renewable wood pieces/leaves are installed crosswise to provide stability

Bottom Layer -

Laid transversely to the middle layer to further improve stability

Wood by its nature is anti-allergenic, visually pleasing, warm underfoot, regulates micro-climates and is easy to install with a click system.

MULTI-LAYER ENGINEERED FLOORING

Surface protection

Rubio Monocoat oil of top quality + wax

Lamella

a hard layer made exclusively of oak wood

Multilayer core

balancing layer - Baltic waterproof birch

Stabilizing base

stabilizing layer of homogeneous wood

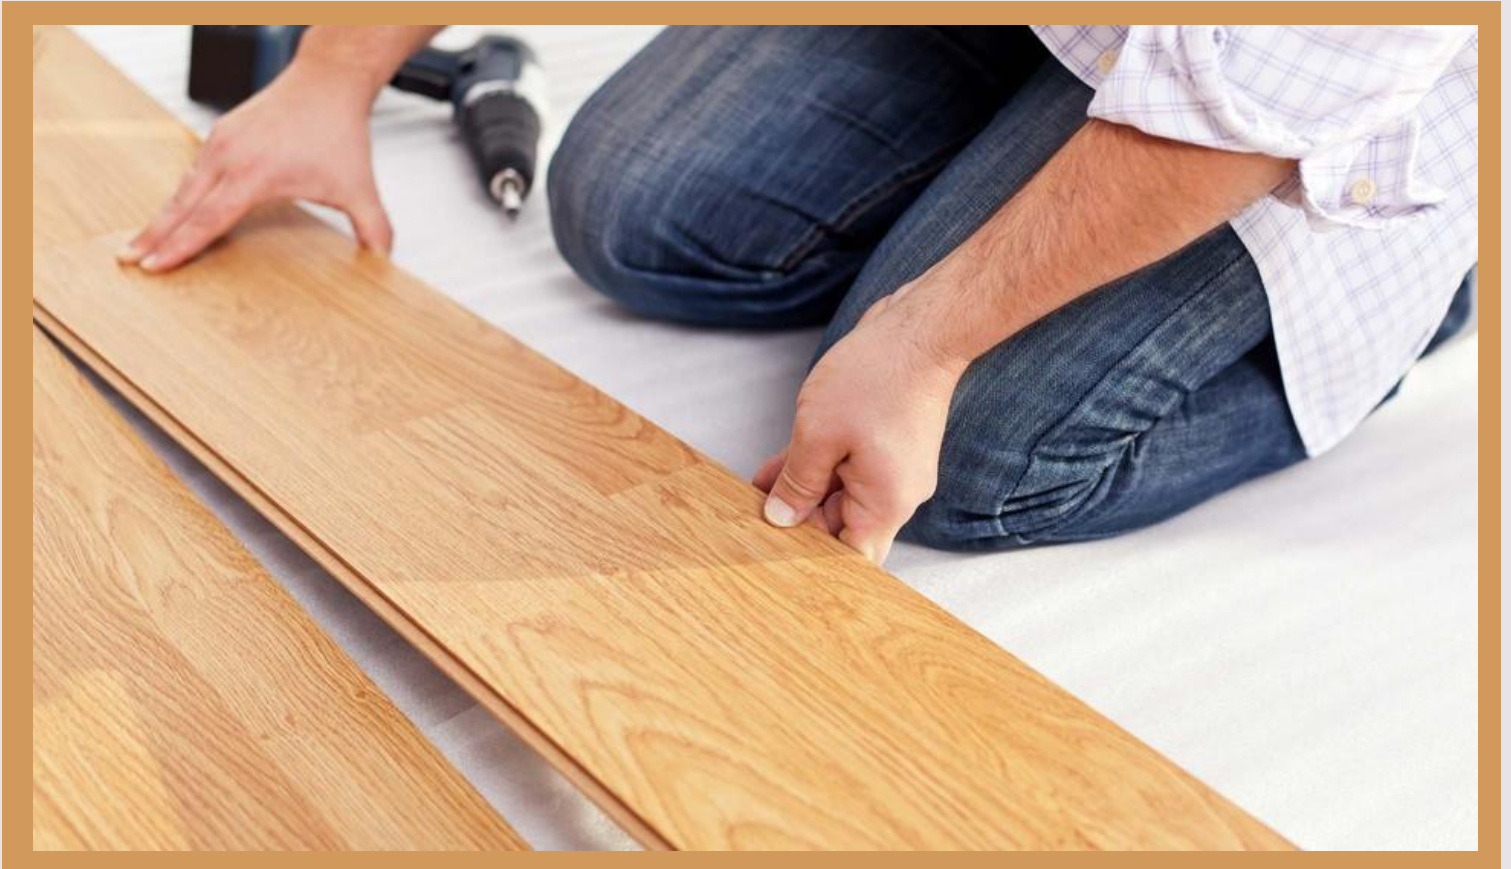

3-LAYER ENGINEERED FLOORING VS MULTI-LAYER ENGINEERED FLOORING

Features	3-Layer Engineered Flooring	Multi-Layer Engineered Flooring
Construction	Three-layer engineered wood, as the name suggests, is composed of three layers of wood veneers bonded together.	Multilayered engineered wood consists of several layers of wood veneers stacked and glued together in a crisscross pattern.
Cost	Three-layer engineered wood might be more affordable than multilayered options because of its simpler construction and fewer layers.	Multilayered engineered wood might be more expensive due to its complex manufacturing process and higher number of layers.
Resilience to Room Conditions	More likely to risk damage from moisture and temperature fluctuations.	Better equipped to withstand moisture and temperature fluctuations.
Underfloor Heating Compatibility	May not be as suitable for underfloor heating as multi-ply.	Generally recommended for underfloor heating due to the resilience of multiple layers.
Overall Stability	Generally less stable compared to multi-ply due to fewer layers.	More stable due to more layers, providing a stronger and more resilient structure.

Conclusion :- Multi-layer engineered wood flooring is undoubtedly the superior option when compared to its 3-layer counterpart. Its increased durability, enhanced aesthetics, superior sound insulation, structural stability, and eco-friendliness make it the ideal choice for both residential and commercial spaces. With its vast range of styles and finishes, multi-layer engineered wood flooring can withstand various environmental conditions, making it a versatile and sustainable flooring solution that can elevate the look and performance of any interior space. Choose multi-layer engineered wood flooring today for a high-quality and durable flooring solution that will stand the test of time.

INSTALLTION PROCESS

1. **Preparation:** Ensure that the subfloor is clean, dry, level, and free from any debris or irregularities. This may involve removing existing flooring materials and applying a suitable underlayment if necessary.
2. **Acclimation:** Allow the wooden flooring materials to acclimate to the room's temperature and humidity levels for a specified period, usually recommended by the manufacturer. This helps to prevent issues such as warping or buckling after installation.
3. **Layout Planning:** Plan the layout of the flooring boards to ensure a balanced and aesthetically pleasing installation. Consider factors such as the direction of the wood grain, the placement of seams, and any special patterns or features desired.
4. **Installation:** Depending on the type of wooden flooring chosen, installation methods may vary. Common methods include nail-down, glue-down, or floating installations. Follow the manufacturer's instructions and use appropriate tools and fasteners for the chosen installation method.
5. **Trimming and Finishing:** Trim the edges of the flooring as needed to fit around obstacles such as door frames or cabinets. Install transition strips where the wooden flooring meets other types of flooring materials. Finally, apply any desired finish or sealant to protect the wood and enhance its appearance.
6. **Cleanup:** Once the installation is complete, clean up any debris or excess materials from the installation area. Dispose of waste materials properly and ensure that the newly installed wooden flooring is clean and ready for use.

WOOD FLOORING: A TIMELESS INVESTMENT FOR YOUR HOME
